README

You will learn:

- ☐ The basic definition of practical text mining
- ☐ Why text mining is important to the modern enterprise
- ☐ Examples of text mining used in enterprise
- ☐ The challenges facing text mining
- ☐ Example workflow for processing natural language
- ☐ A simple text mining example
- ☐ When text mining is appropriate

What is "text mining"?

Figure 1: Four monks by Claudio Rinaldi (1852-1909), Dorotheum, Munich

"Text mining is the process of distilling actionable insights from text." Kwartler, 2019

- ☐ What does "distilling actionable insights" mean?¹

"Text [data] mining is the process of transforming unstructured text into a structured format to identify meaningful patterns and new insights." IBM, 2023

- ☐ What does "structured" and "unstructured data" mean? What are "meaningful patterns"?²

¹Distillation is a process of extracting an essence (a wanted substance) and getting rid of unwanted substances. Actionable insights are insights that one can use to make decisions (action in business is usually accompanied by decision-making).

²(Source) Structured data are data in tabular format with specific data types for digital processing. Unstructured data do not have a specific data format.

- What about the text on this page (Org-mode file): structured or not?³

What is text mining in practice (= business)?

Customer services

Identify useful social media posts for customer services.

Marketing

Measure campaign success for marketing purposes.

Human resources

Match job descriptions to resumes for human resources.

Why should you care about text mining?

"To be truly **customer-centric** in a **hyper-competitive** environment, an organization should be listening to their constituents whenever possible. Yet the amount of textual information from these interactions can be immense, so text mining offers a way to extract insights quickly." Kwartler, 2019

Examples:

- **Relevance** of social media for public opinion (e.g. Twitter)
- **Growth** of online content from an organization (e.g. blogs)
- **Digitization** of paper records (e.g. healthcare)
- **Automatic** translation of natural language (e.g. Google Translate)
- **Augmentation** of human work through chatbots (e.g. ChatGPT)

³The Org-mode file is semi-structured! Semi-structured data carry meta information in the form of markup - e.g. HTML, XML, JSON, or Org-mode: the header information at the top of the file structures the data, as does the Org-mode format itself, which comes with a markup language.

Vox populi - the "wisdom of crowds"

In 1907, Francis Galton published a paper exploring whether a crowd could be intelligent. His analysis used entries submitted to a contest held at an agricultural fair in Plymouth, England [1]. The participants, many of whom were butchers and farmers, competed at judging how much a "fat ox" would weigh after it had been slaughtered and dressed. They wrote their estimates on cards, which were later loaned to Galton for analysis. There were 787 eligible entries. The median value of these estimates (what Galton called the "middlemost estimate") was 1207 pounds, amazingly close to the actual weight of the dressed ox: 1198 pounds. Although the individual estimates varied widely, they had a central tendency very close to the true value. Even though the contestants made errors, some guessing too high and others guessing too low, the "vox populi" seemed to produce an estimate that was better than what could be expected from any individual expert.

Figure 5: Source: Patten, 2015

"Under the right circumstances, groups are remarkably intelligent, and are often smarter than the smartest people in them."
Surowiecki, 2005

The "right circumstances": no assessment bias =

1. Assessors need to exercise *independent* judgements
2. Assessors need to possess *diverse* information understanding
3. Assessors need to rely on *decentralized, local* knowledge.
4. There has to be a way to *aggregate* or tabulate the results.
5. ☐ How about Amazon.com reviews - do they meet these conditions?⁴

⁴(1) reviews may not be independent since reviewers have access to old reviews, which may influence them (it's harder to have a different opinion from everyone else). (2) Diversity is hard to measure but in the case of Amazon.com, a national audience can be seen as highly diverse (there are nearly 150 mio subscribers of Amazon Prime in the US alone).

Beneficiaries and benefits of text mining

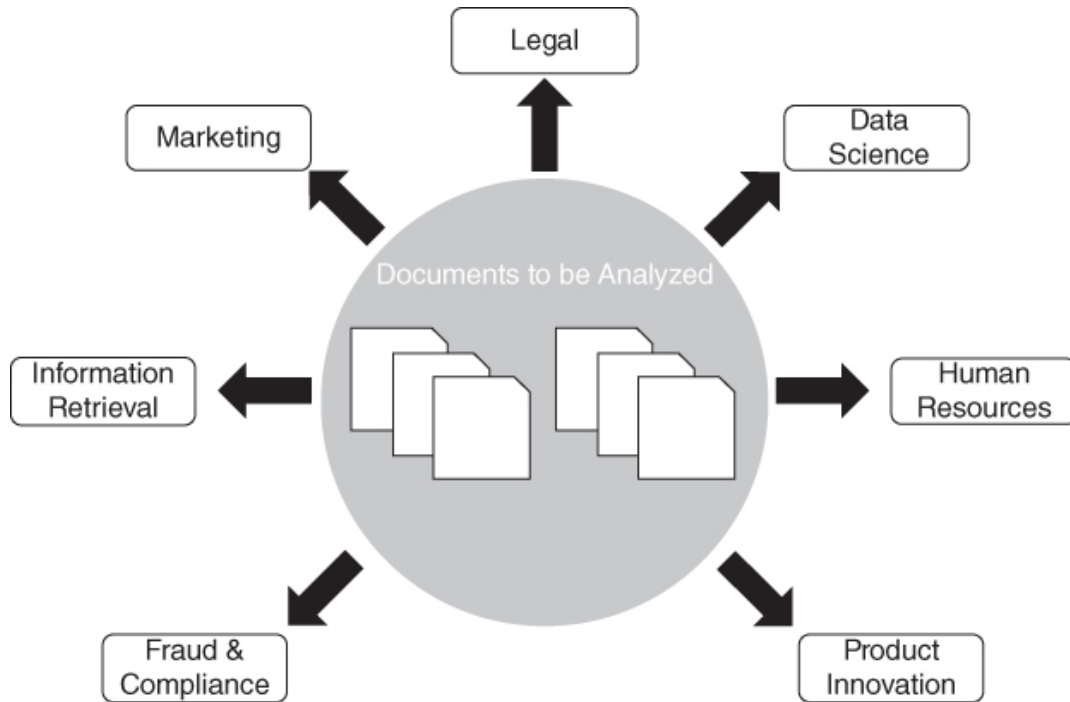

Figure 6: Applications that use text mining

- Benefits include:

1. Trust among stakeholders because little to no *sampling* is needed to extract information (all available text sources can be used).
2. The methodologies can be applied quickly (text processes fast).
3. Using R allows for *auditable* and *repeatable* methods.
4. Text mining identifies novel *insights* or reinforces existing perceptions based on all relevant information.

(3) Local here means "not only at a distance" - only "verified purchase" reviews fulfil this condition in principle. (4) Tabulation of the reviews relies on text mining, and hence - unlike in the case of Galton - not on recording simple numbers. Stochastic procedures (probability distributions) are involved.

- The "opinion" of ChatGPT looks comprehensive as always - does this chatbot represent "**vox populi**"? Are all criteria fulfilled?⁵
- ☐ Whom would you trust more - the expert author or the chatbot, and why?⁶

When to use and when not to use text mining

| Example use case | Recommendation |
|---------------------------------------|--|
| Survey texts | Explore topics using various methods to gain a respondent's perspective. |
| Reviewing a small number of documents | Don't perform text mining on an extremely small corpus, as the results and conclusion can be skewed. |
| Human resource documents | Tread carefully; text mining may yield insights, but the data and legal barriers may make the analysis inappropriate. |
| Social media | Use text mining to collect (when allowed) from online sources and then apply preprocessing steps to extract information. |
| Data science predictive modeling | Text mining can yield structured inputs that could be useful in machine learning efforts. |
| Product/service reviews | Use text mining if the number of reviews is large. |
| Legal proceeding | Use text mining to identify individuals and specific information. |

Figure 7: Example use cases and recommendations for text mining

- "*Use case*": an application scenario used for illustration
- *Lists* should always be ordered (explicitly or implicitly)
- ☐ How could one order the list of example use cases?⁷

Language is not like other data

- ☐ What is special about language data?⁸

⁵ChatGPT is source from a very large number of textual documents but it is impossible to ascertain any of the criteria when identifying the chatbot as the "assessor".

⁶For me personally, knowledge about a source increases trust in believing that source while lack of knowledge decreases the trust. In the case of ChatGPT, I asked the bot about its sources but its answer was redundant and not overly satisfying (see for yourself).

⁷Alphabetically, by importance (to someone), by number of applications, by number of users, by time (history).

⁸Language is used for communication; it is thought to be divine or at least strongly linked to the divine ("In the beginning was the Word, and the Word was with God, and the Word was God." John 1:1); it may be that only humans have language; it is learnt.

Figure 8: Pieter Brueghel the Elder, The Tower of Babel

- "The true origin of language may never be known." (ChatGPT)
- Text mining reduces the information available in language

Avoid word clouds - beware of the cliché

- Use them in conjunction with other methods to confirm the correctness of a conclusion
- ☐ What do you think why word clouds are still so attractive?

Basic text mining workflow

1. **Define** the problem and specific goals (e.g. how best to market)
2. **Identify** the text that needs to be collected (e.g. Twitter API)
3. **Organize** the text (e.g. into a corpus for "bag of words")
4. **Extract** features for analysis (e.g. make text lower case)

Figure 10: Text mining workflow from Kwartler (2019)

5. **Apply** techniques to the prepared text (e.g. keyword search)
6. **Reach** an insight or recommendation (e.g. marketing focus)

Which tools are needed?

Figure 11: Photo by Hunter Haley on Unsplash

- Sufficient RAM for R (all processing is done in memory)
- Installation of R and an IDE like RStudio or Emacs + ESS + Org-mode
- Set of R packages and example data
- Any operating system (Linux is to be preferred)

Simple example: mining customer reviews

- You're a Nike employee who wants to know how consumers are viewing the Nike Men's Roshe Run Shoes. Follow these steps:
 1. **Goal definition:** Using online reviews, identify overall positive or negative views. For negative views, identify cause to be shared with the product manager.
 2. **Data collection:** For a mass market product, use retail website like Amazon for hundreds of timestamped reviews (to ensure currency).
 3. **Text organisation:** Web scrape all reviews into a CSV file with one review per row, timestamp and star rating to later subset corpus by these features.
 4. **Feature extraction:** clean reviews to analyze text features, e.g. removing common words with little benefit ("shoe", "nike", "running" etc.). Check for spelling and make all text lowercase.
 5. **Text analysis:** scan for specific group of keywords depending on product issues ("fit", "rip", "tear", "narrow", "wide", "sole"). Sum group counts to order problematic features.
 6. **Insight generation:** present findings to product manager that the top consumer issue is "narrow" and "fit" to aid product design, marketing or improvement decisions.

Real world example: competitive intelligence

- Text mining can help to understand the basics of a competitor's text based marketing (for further analysis, contrast or imitation)
- When creating Amazon.com's social customer service team, they were "obsessed with how others were doing it".

- They read and reviewed other companies customer replies and learnt from their missteps.⁹
- In 2012, social media based customer service was considered to be highly risky, involving legal counsel, branding, and leadership.
- In 2012, Wal-Mart, Dell and Delta Airlines were considered best in class social customer service companies.
- Each brand owner (Amazon Prime, Amazon Kindle etc.) had cultivated their own style of communicating via social media (like dialects).
- Every communication channel was supposed to execute flawlessly and be 100% customer-centric.
- Goal: develop social media cautiously to maintain current quality set by multiple stakeholders.
- Initial channels: two help forums, retail and Kindle Facebook pages and Twitter.
- Text mining was a tool to analyze competitors' use of social media for customer services: length of a reply (e.g. Twitter limit), language used, typical customer agent workload, and if posting similar links repeatedly made sense, what types of help links to post (forms, resource links?), how many people should be doing this, etc.
- Text mining focused on three questions for about one year:
 1. What is the average length of a social customer service reply?
 2. What links were referenced most often?
 3. How many social replies is reasonable for a customer service agent to handle?
- By 2017, Amazon was a leading force in this space (WBR, 2023)

Final definition for "text mining"

"Text mining represents the ability to take large amounts of unstructured language and quickly extract useful and novel insights that can affect stakeholder decision-making."

⁹This reminds me of my own experience with CISCO customer services when working at Shell and visiting CISCO to (openly) learn from their knowledge sharing experiences.

TM Glossary

| TERM | MEANING |
|--------------------------|-------------------------------------|
| Text mining | Identify useful patterns in text |
| Structured data | Tabular data (rows and columns) |
| Semi-structured data | Markup with meta data |
| Wisdom of crowds | Intelligence exhibited by groups |
| Use case | Illustrative application scenario |
| Feature extraction | Preprocess text for analysis |
| Corpus | Body of text to be analyzed |
| Stakeholder | Someone who cares |
| Competitive intelligence | Information about one's competitors |
